SUMMARY

Software engineer with 6 years of experience who designs and orchestrates composable, distributed systems. At Sistecrédito, I architect fintech solutions end to end: micro-frontends and nano-architectures, .NET microservices with gRPC, Azure Service Bus and SQL, and event pipelines from AWS to Azure for a ~700-agent contact center. I improved a critical embedded app's performance by ~90% and automated legacy rollouts to ~1,000 computers with zero downtime.

My foundation comes from airline retailing at FLYR, where I moved from client accounts to the core product every airline extends from. Outside work, I founded Synergos Labs, a composable platform built on Umbraco (.NET), a CDN-delivered component library and a framework-agnostic backend-for-frontend.

EXPERIENCE

Software Solutions Engineer · AI-First — Sistecrédito — Feb 2026 – Present · Medellín (remote)

Official title: Development Solutions Engineer – AI First

- Build and maintain 10+ micro-frontends on Native Federation and 4+ .NET microservices, used by 4+ teams across the company.
- Improved the performance of the contactability app embedded in Genesys Cloud by ~90% versus its first release: optimized Native Federation's heavy first-load prefetching and analyzed how the Genesys Gold Partner's middleware used Genesys webhooks and APIs, proposing changes that both teams implemented.
- Built an event pipeline for a contact center of ~700 agents handling thousands of interactions a day: Genesys events from AWS EventBridge (calls, SMS, WhatsApp, inbound and outbound) mapped through a Redpanda Connect pipeline into Azure Service Bus, consumed by a horizontally scalable .NET microservice.
- Automated the rollout of legacy desktop applications for collections and customer-service teams to ~1,000 computers through Microsoft Intune, using Windows UI automation scripts in a 40-minute window: 80% success on the first run and zero downtime, replacing about a week of manual installs by a full team.
- Built AI agent skills for the engineering teams: one turns a UI screenshot into component proposals that follow the company's design system; another guides teams in embedding micro-frontends into the Native Federation shell.

Development Solutions Engineer — Sistecrédito — Mar 2025 – Feb 2026 · Medellín (remote)

- Brought airline-platform experience into fintech, delivering micro-frontends that combine .NET server-side rendering with Angular.
- Designed the cross-origin communication protocol (window.postMessage) that embeds the company's contactability app inside Genesys Cloud, keeping sensitive data out of message payloads.
- Implemented granular GA4/GTM analytics events and improved accessibility (focus management, WCAG).

Founder & Software Architect — Synergos Labs — Feb 2024 – Present · Personal project

- Created Synergos, a composable digital platform that lets any business assemble its digital products from a library of 30+ reusable components.
- Umbraco (.NET) acts as the composition layer; a separate project deployed on a CDN serves the resources that feed it.
- Clean backend-for-frontend composition, framework-agnostic by design down to its import paths, proven with 3+ web frameworks.
- Designed and built each component deliberately, then piloted the platform through spec-driven development with AI agents.

Frontend Web Developer — FLYR — Mar 2023 – Mar 2025 · Colombia (remote)

- Moved from client accounts to FLYR's core product, the airline retailing platform that every airline account extends from.
- Led the architecture and development of the Check-in and Manage My Booking modules, deployed across 3+ major international airlines.
- Contributed to the PCI module and franchise payment integration with an external payment gateway, building secure Angular checkout components.
- Worked on a voucher redemption project for a major airline with TypeScript, Angular and .NET.
- Coordinated releases tailored to each airline account, worked directly with clients and mentored developers on Angular, TypeScript and .NET architecture decisions.

Angular · TypeScript · .NET · Umbraco CMS (SSR) · Azure · Sass

Frontend Web Developer — Newshore (a FLYR Labs company) Jul 2022 – Mar 2023 · Colombia

Moved to FLYR after FLYR acquired Newshore

- Led frontend development on airline web platforms, including the Avianca PWA, from design handoff to production.
- Helped launch 3+ airline web platforms as part of the setups team.
- Delivered pixel-perfect, accessible interfaces with the UX team, aligned with WCAG and ARIA, using module-based .NET and Angular solutions on Umbraco CMS, deployed on Azure.

Frontend Web Developer — Growup IT Jan 2019 – Nov 2019 · Armenia, Colombia · Practicum

- Refactored a government tax-payment portal (PHP, HTML, JavaScript), optimizing assets and page composition to raise its Lighthouse performance score by ~40 points.
- Owned project architecture and packaging, introducing component-based development; designed interfaces in Figma.

TECHNICAL SKILLS

Architecture	Distributed systems, composable architecture, micro-frontends, nano-architectures, microservices, backend for frontend, event-driven architecture, API and system design, Clean Architecture, SOLID, design patterns
Backend	.NET, C#, ASP.NET, Razor, Blazor, gRPC, REST APIs, NestJS, Node.js, Express, Python (scripting), SQL, MongoDB
Messaging & cloud	Azure, Azure Service Bus, AWS, AWS EventBridge, Redpanda Connect, CDN delivery, Microsoft Intune, CI/CD
Frontend	Angular (Signals, SSR, hydration), NgRx, TypeScript, JavaScript, React, Next.js, Native Federation, Web Components, Sass, NX monorepos, Ionic
CMS	Umbraco (headless and SSR), Strapi
Integrations & analytics	Genesys Cloud, WebSockets, cross-origin messaging (postMessage), payment gateways (PCI), GA4, Google Tag Manager
AI-first engineering	Spec-driven development, AI coding agents (Claude Code), agent harnesses and custom agent skills, context and prompt engineering, AI-assisted code review and documentation
Engineering practices	Legacy modernization, pixel-perfect UI, web performance, accessibility (WCAG, ARIA), unit and integration testing, code reviews, Git, Agile/Scrum, Figma
Product & business	Product thinking, translating business needs into architecture, stakeholder communication, technical proposals and architecture decision records
Currently learning	Microcontrollers, sensors, robotics

HOW I WORK

I work AI-first and spec-driven, grounded in Clean Architecture, SOLID and design patterns: I write the specification before the code, then use AI agents to research, scaffold, review and document. AI amplifies the engineering; the design decisions stay human, and I write code for humans to read. As a former business administrator, I translate business needs into architecture and think about the people behind every system.

EDUCATION

Business Administration — Institución Universitaria EAM, Armenia · Graduated with honors, emphasis in Business Creation 2013 – 2017

Systems Engineering (coursework, not completed) — Universidad Nacional Abierta y a Distancia (UNAD) 2020 – 2023

Frontend Development, Platzi Master — Platzi 2018 – 2022

CERTIFICATIONS

140+ certified courses in software development (Platzi), including Software Architecture Fundamentals (Nov 2025).

LANGUAGES

Spanish — native
English — B1 (B2 in regular professional use)

INTERESTS

Composable systems, AI-assisted engineering, technology with real-world impact, endurance sports (HYROX).
